

The Twelve-Factor App

Let's discuss the Twelve-Factor App, a methodology for building cloud applications, which outlines twelve key principles for designing scalable, maintainable, and robust web applications. The methodology emphasizes best practices for codebase management, configuration, deployment, and operational processes, aiming to make applications easier to build, deploy, and scale in cloud environments.

Table of contents

By following these principles, developers can create apps that are portable across different platforms, resilient to changes, and straightforward to manage. For a deeper understanding of each factor and how to apply them, you should explore the [official Twelve-Factor App website](#).
